(54) **Boron-free additive composition, method for producing same and using in lubrication of motor vehicle gears.**

(57) A lubricating oil composition comprising:

a base oil;
at least one boron-free ashless dispersant selected from hydrocarbyl substituted succinimides, hydrocarbyl substituted succinic acids and hydrocarbyl substituted succinamides;
at least one sulfur source selected from sulfurized polyisobutylenes and polysulfides; and
at least one phosphorus source selected from oil-soluble amine salts of formula:

in which R⁶ is a hydrocarbyl group having 2 to 12 carbon atoms, each X is independently S or O, Y is selected from a hydrocarbyl group having 2 to 12 carbon atoms, +NH₃R⁷ or H, R⁷ is a hydrocarbyl group having 4 to 30 carbon atoms, Z is selected from a hydrocarbyl group having 2 to 12 carbon atoms, +NH₃R⁸ or H and R⁸ is a hydrocarbyl group having 4 to 30 carbon atoms, provided that Y is +NH₃R⁷ and/or Z is +NHR⁸,
wherein the total amount of the ashless dispersant, sulfur source and phosphorus source is 1 to 10 percent by weight of the lubricating oil composition and wherein the proportions of the dispersant, the sulfur source and the phosphorus source are selected such that the lubricating oil composition has an L-60-1 carbon/varnish rating of at least about 7.5 and an L-60-1 sludge rating of at least about 9.4.

EP 0 848 052 A2

DescriptionBackground of the Invention5 1. Field of the Invention

The present invention relates to a clear gear boron-free gear additive employing a boron-free ashless dispersant, a sulfur source and a phosphorus source. More particularly, the preferred boron-free ashless dispersant is a hydrocarbyl succinimide.

10

15 2. Background Discussion

The term "clean gear lubricating oil" is a term of art for lubricating oil which contains dispersant so that gears which it lubricates remain clean during use. Conventionally, clean gear manual transmission oil and rear axle oil employ dispersants to keep gears clean. However, the oils which are known to meet strict requirements such as MT-1 (an SAE standard for clean gear manual transmission oil) as well as MIL-PRF-2105E (a standard promulgated by the U.S. Army Tank Automotive and Armaments Command, Department of the Army, for rear axle oil) employ boronated dispersant. It would be desirable to employ non-boronated dispersant, but conventional wisdom believed boron was necessary for such oils.

20

U.S. Patent No. 5,354,484 to Schwind et al discloses lubricating oil and functional fluid compositions containing a major amount of an oil of a lubricating viscosity and a minor amount of at least one soluble tertiary aliphatic primary amine salt of a substituted phosphoric acid and at least one soluble nitrogen-containing composition prepared by the reaction of a hydrocarbon-substituted succinic acid-producing compound with at least about one-half equivalent, per equivalent of acid producing compound, of an amine containing at least one hydrogen atom attached to a nitrogen atom. Preferably, U.S. Patent No. 5,354,484 also discloses lubricant for gear assemblies of differentials consisting of a composition of the '484 patent and a substantially hydrocarbon polysulfide. However, U.S. Patent No. 5,354,484 makes no mention of whether its oils meet the strict requirements MT-1 or MIL-PRF-2105E.

30

Summary of the Invention

It is an object of the present invention to provide a clean gear capable boron-free gear additive which meets certain L-60-1 lubricant standards.

It is another object of the present invention to provide a method for making a gear oil or rear axle oil composition which is boron-free.

35

It is another object of the present invention to provide additive systems for a gear oil or rear axle oil composition.

The present invention relates to a clean gear capable boron-free gear additive. This is an additive for a gear oil or rear axle oil composition containing:

40

a boron-free nitrogen-containing ashless dispersant (component 1), a sulfur source (component 2), a phosphorus source (component 3) along with other optional ingredients. This additive composition when blended with a suitable base oil can unexpectedly meet MT-1 and MIL-PRF-2105E requirements without the need for boron. MT-1 is a requirement for a clean gear manual transmission oil. MIL-PRF-2105E is a requirement for a rear axle oil. In contrast, for this type of clean gear use, conventional oils are formulated with a boronated dispersant. The type of dispersant especially relates to L-60-1 tests common to both MT-1 and MIL-PRF-2105E. The L-60-1 test performance criteria include % viscosity increase, % pentane insolubles, % toluene insolubles, carbon/varnish rating and sludge rating.

45

The benefits of using a boron-free dispersant include: (i) a lower cost due to not having to add boron or to do additional processing to attach the boron to the dispersant, and (ii) no problems from precipitation of boron which detaches from the dispersant.

50

Component 1 : Boron-Free Nitrogen-Containing Ashless Dispersants

Component 1 utilized in the compositions of this invention is comprised of the boron-free nitrogen-containing ashless dispersants. Thus, the composition contains at least one nitrogen-containing ashless dispersant such as a hydrocarbyl substituted succinimide, a hydrocarbyl substituted succinic acid, or a hydrocarbyl substituted succinamide. Typically, the additive is devoid of succinimide compound wherein a single nitrogen atom is bound to H and two carbonyl groups.

55

The hydrocarbyl substituted succinimide is at least one soluble nitrogen-containing composition prepared by the reaction of a hydrocarbon-substituted succinic acid-producing compound (herein sometimes referred to as the "succinic acylating agent") with at least about one-half equivalent, per equivalent of acid-producing compound, of an amine

containing at least one hydrogen attached to a nitrogen group. The nitrogen-containing compositions obtained in this manner are usually complex mixtures whose precise composition is not readily identifiable. Thus, the compositions generally are described in terms of the method of preparation. The nitrogen-containing compositions are sometimes referred to herein as "acylated amines". The nitrogen-containing compositions are either oil-soluble, or they are soluble in oil-containing lubricating and functional fluids of this invention.

The soluble nitrogen-containing compositions useful in the lubricating compositions of the present invention are known in the art and have been described in many U.S. patents including 3,172,892; 3,215,707; 3,272,746; 3,316,177; 3,341,542; 3,444,170; 3,454,607; 3,541,012; 3,630,904; 3,632,511; 3,787,374; 4,234,435; and 5,354,484.

The above U.S. patents are expressly incorporated herein by reference for their teaching of the preparation of nitrogen-containing compositions. However, boron-containing compositions of any of these references are expressly excluded from the present invention.

In general, a convenient route for the preparation of the soluble nitrogen-containing compositions comprises the reaction of a hydrocarbon-substituted succinic acid-producing compound ("carboxylic acid acylating agent") with an amine containing at least one hydrogen attached to a nitrogen atom (i.e., H-N=). The hydrocarbon-substituted succinic acid-producing compounds include the succinic acids, anhydrides, halides and esters. The number of carbon atoms in the hydrocarbon substituent on the succinic acid-producing compound may vary over a wide range provided that the nitrogen-containing composition is soluble in the lubricating compositions of the present invention. Thus, the hydrocarbon substituent generally may contain an average of at least about 30 aliphatic carbon atoms and preferably contains an average of at least about 50 aliphatic carbon atoms. In addition to the oil-solubility considerations, the lower limit on the average number of carbon atoms in the substituent also is based upon the effectiveness of such compounds in the lubricating oil compositions of the present invention. The hydrocarbyl substituent of the succinic compound may contain polar groups if the polar groups are not present in proportions sufficiently large to significantly alter the hydrocarbon character of the substituent.

The sources of the substantially hydrocarbon substituent include principally the high molecular weight, substantially saturated, petroleum fractions and substantially saturated olefin polymers, particularly polymers of mono-olefins having from 2 to 30 carbon atoms per mono-olefin. The especially useful polymers are the polymers of 1-mono-olefins such as ethylene, propene, 1-butene, isobutene, 1-hexene, 1-octene, 2-methyl-1-heptene, 3-cyclohexyl-1-butene, and 2-methyl-5-propyl-1-hexene. Polymers of medial olefins, i.e., olefins in which the olefinic linkage is not at the terminal position, likewise are useful. They are illustrated by 2-butene, 3-pentene, and 4-octene.

Also useful are the interpolymers of the olefins such as those illustrated above with other interpolymerizable olefinic substances such as aromatic olefins, cyclic olefins, and polyolefins. Such interpolymers include, for example, those prepared by polymerizing isobutene with styrene; isobutene with butadiene; propene with isoprene; ethylene with piperylene; isobutene with chloroprene; isobutene with p-methyl styrene; 1-hexene with 1,3-hexadiene; 1-octene with 1-hexene; 1-heptene with 1-pentene; 3-methyl-1-butene with 1-octene; 3,3-dimethyl-1-pentene with 1-hexene; isobutene with styrene and piperylene; etc.

In preparing the substituted succinic acylating agents of this invention, one or more of the above-described polyalkylenes is reacted with one or more acidic reactants selected from the group consisting of maleic or fumaric reactants such as acids or anhydrides. Ordinarily the maleic or fumaric reactants will be maleic acid, fumaric acid, maleic anhydride, or a mixture of two or more of these. The maleic reactants are usually preferred over the fumaric reactants because the former are more readily available and are, in general, more readily reacted with the polyalkenes (or derivatives thereof) to prepared the substituted succinic acid-producing compounds useful in the present invention. The especially preferred reactants are maleic acid, maleic anhydride, and mixtures of these. Due to availability and ease of reaction, maleic anhydride will usually be employed.

For convenience and brevity, the term "maleic reactant" is often used hereinafter. When used, it should be understood that the term is generic to acidic reactants selected from maleic and fumaric reactants. Also, the term "succinic acylating agents" is used herein to represent the substituted succinic acid-producing compounds.

One procedure for preparing the substituted succinic acylating agents of this invention is illustrated, in part, in U.S. Patent No. 3,219,666 which is expressly incorporated herein by reference for its teachings in regard to preparing succinic acylating agents. This procedure is conveniently designated as the "two-step procedure". It involves first chlorinating the polyalkene until there is an average of at least about one chloro group for each molecular weight of polyalkene. For purposes of this invention, the molecular weight of the polyalkene is the weight corresponding to the number average molecular weight (Mn) value. Chlorination involves merely, contacting the polyalkene with chlorine gas until the desired amount of chlorine is incorporated into the chlorinated polyalkene. Chlorination is generally carried out at a temperature of about 75°C to about 125°C.

The second step in the two-step chlorination procedure, for purposes of this invention, is to react the chlorinated polyalkene with the maleic reactant at a temperature usually within the range of about 100°C to about 200°C. The mole ratio of chlorinated polyalkene to maleic reactant is usually about 1:1. (For purposes of this invention, a mole of chlorinated polyalkene is that weight of chlorinated polyalkene corresponding to the Mn value of the unchlorinated

polyalkene.) However, a stoichiometric excess of maleic reactant can be used, for example, a mole ratio of 1:2.

The resulting polyalkene-substituted succinic acylating agent is, optionally, again chlorinated if the desired number of succinic groups are not present in the product.

Another procedure for preparing substituted succinic acid acylating agents of the invention utilizes a process described in U.S. Patent No. 3,912,764 and U.K. Patent No. 1,440,219, both of which are expressly incorporated herein by reference for their teachings in regard to that process. According to that process, the polyalkene and the maleic reactant are first reacted by heating them together in a "direct alkylation" procedure.

The amines which are reacted with the succinic acid-producing compounds to form the boron-free nitrogen-containing compositions may be monoamines and polyamines. The monoamines and/or polyamines must be characterized by the presence within their structure of at least one primary (i.e., H₂N-) or secondary (i.e., H-N=) amino group. The amines may be aliphatic, cycloaliphatic, aromatic, or heterocyclic. Moreover, the amines may be unsubstituted or aliphatic-substituted, cycloaliphatic substituted or aromatic-substituted. Also the amines may be saturated or unsaturated. The amines may also contain non-hydrocarbon substituents or groups as long as these groups do not significantly interfere with the reaction of the amines with the acylating reagents of this invention. Such non-hydrocarbon substituents or groups include lower alkoxy, lower alkyl mercapto, nitro, interrupting groups such as -O- and -S- (e.g., as in such groups as -CH₂CH₂-X-CH₂CH₂ where X is -O- or -S-).

In general, the amine of Component 1 may be characterized by the formula: R₁R₂NH, wherein R₁ and R₂ are each independently hydrogen or hydrocarbon, amino-substituted hydrocarbon, hydroxy-substituted hydrocarbon, alkoxy-substituted hydrocarbon, amino, carbamyl, thiocarbamyl, guanyl and acylimidoyl groups provided that only one of R₁ and R₂ may be hydrogen.

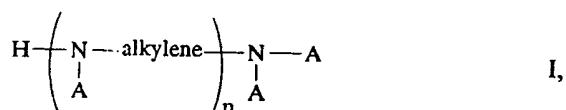

With the exception of the branched polyalkylene polyamine, the polyoxalkylene polyamines, and the high molecular weight hydrocarbyl-substituted amines described more fully hereafter, the amines ordinarily contain less than about 40 carbon atoms in total and usually not more than about 20 carbon atoms in total.

Aliphatic monoamines include mono-aliphatic and di-aliphatic substituted amines wherein the aliphatic groups can be saturated or unsaturated and straight or branched chain. Thus, they are primary or secondary aliphatic amines. Such amines include, for example, mono- and di-alkyl-substituted amines, mono- and dialkenyl-substituted amines, and amines having one N-alkenyl substituent and one N-alkyl substituent and the like. The total number of carbon atoms in these aliphatic monoamines will, as mentioned before, normally not exceed about 40 and usually not exceed about 20 carbon atoms. Specific examples of such mono-amines include ethylamine, diethylamine, n-butylamine, di-n-butylamine, allylamine, isobutylamine, cocoamine, stearylamine, laurylamine, methyllaurylamine, oleylamine, N-methyl-octylamine, dodecylamine, octadecyl-amine, and the like.

Cycloaliphatic monoamines are those monoamines wherein there is one cycloaliphatic substituent attached directly to the amino nitrogen through a carbon atom in the cyclic ring structure.

Aromatic amines suitable include those monoamines wherein a carbon atom of the aromatic ring structure is attached directly to the amino nitrogen.

The polyamines from which the nitrogen-containing ashless dispersant is derived include principally alkylene amines conforming for the most part to the Formula I:

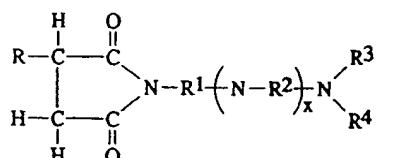

45 wherein n is an integer preferably less than about 10, A is a hydrogen group or a substantially hydrocarbon group preferably having up to about 30 carbon atoms, and the alkylene group is a preferably a lower alkylene group having less than about 8 carbon atoms. The alkylene amines include principally methylene amines, ethylene amines, butylene amines, propylene amines, pentylene amines, hexylene amines, heptalene amines, octylene amines, other polymethylene amines. They are exemplified specifically by: ethylene diamine, triethylene tetramine, propylene diamine, decamethylene diamine, octamethylene diamine, di(heptamethylene) triamine, tripropylene tetramine, tetraethylene pentamine, trimethylene diamine, pentaethylene hexamine, di(trimethylene) triamine. Higher homologues such as are obtained by condensing two or more of the above-illustrated alkylene amines likewise are useful.

50 The nitrogen-containing composition obtained by reaction of the succinic acid-producing compounds and amines may be amine salts, amides, imides, imidazolines as well as mixtures thereof. To prepare the nitrogen-containing composition, one or more of the succinic acid-producing compounds and one or more of the amines are heated, optionally in the presence of a normally liquid, substantially inert organic liquid solvent/diluent at an elevated temperature generally in the range of from about 80°C up to the decomposition point of the mixture or the product. Normally, temperatures in the range of about 100°C up to about 300°C are utilized provided that 300°C does not exceed the de-

composition point: The succinic acid-producing compound and the amine are reacted in amounts sufficient to provide at least about one-half equivalent, per equivalent of acid-producing compound, of the amine. Generally, the maximum amount of amine present will be about 2 moles of amine per equivalent of succinic acid-producing compound. For the purposes of this invention, an equivalent of the amine is that amount of the amine corresponding to the total weight of amine divided by the total number of nitrogen atoms present.

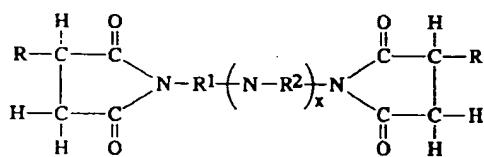

5 A preferred boron-free nitrogen-containing ashless dispersant of the present invention is a mixture of Formula IIa and Formula IIb:

10

IIa,

15

IIb,

25

wherein R is a C₂ to C₃₀ polyalkylene moiety, preferably polyethylene, polypropylene and polybutylene (especially polyisobutylene).

30

R¹ is an alkyl having 1 to 40 carbon atoms, preferably 1 to 10 carbon atoms, more preferably 1 to 5 carbon atoms, most preferably R¹ is (CH₂)_n, wherein n is an integer from 1 to 5.

35

R² is an alkyl having 1 to 40 carbon atoms, preferably 1 to 10 carbon atoms, more preferably 1 to 5 carbon atoms, most preferably R² is (CH₂)_m, wherein m is an integer from 1 to 5,

R³ is selected from the group consisting of H and an alkyl having 1 to 40 carbon atoms, preferably H and an alkyl having 1 to 10 carbon atoms,

40

R⁴ is selected from the group consisting of H and an alkyl having 1 to 40 carbon atoms, preferably H and an alkyl having 1 to 10 carbon atoms,

parameter X is an integer ranging from 0 to 12, preferably 2 to 8, more preferably 2 to 5, and there being an absence of a succinimide compound wherein a single nitrogen atom is bound to H and two carbonyl groups.

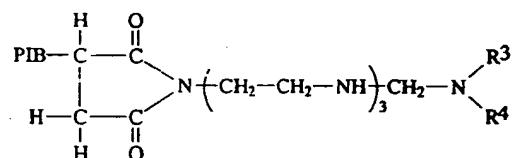

45

The preferred ashless dispersants are hydrocarbyl succinimides in which the hydrocarbyl substituent is a hydrogenated or unhydrogenated polyolefin group and preferably a polyisobutylene group having a number average molecular weight (as measured by gel permeation chromatography) of from 700 to 10,000, and more preferably from 700 to 5,000, more preferably from 750 to 2,500, and most preferably 950 to 1350.

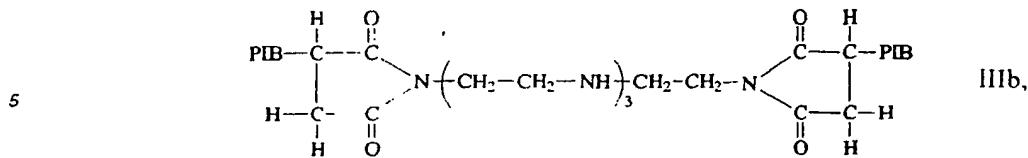

50

An example of a preferred boron-free ashless dispersant is a mixture of polyisobutylene succinimide-polyethylene-enepolyamine of Formula IIIa and IIIb:

55

IIIa,

wherein PIB is polyisobutylene, R³ is H and R⁴ is H.

10

Component 2: Sulfur-Containing Agent

A wide variety of sulfur-containing extreme pressure or antiwear agents are available for use in the practice of this invention. Among suitable compositions for this use are included sulfurized animal or vegetable fats or oils, sulfurized animal or vegetable fatty acid esters, fully or partially esterified esters of trivalent or pentavalent acids of phosphorus, sulfurized olefins (see for example U.S. Patent Nos. 2,995,569; 3,673,090; 3,703,504; 3,703,505; 3,796,661; 3,873,545; 4,119,549; 4,119,550; 4,147,640; 4,191,659; 4,240,958; 4,344,854; 4,472,906; and 4,711,736), dihydrocarbyl polysulfides (see for example U.S. Patent Nos. 2,237,625; 2,237,627; 2,527,948; 2,695,316; 3,022,351; 3,308,166; 3,392,201; 4,564,709; and British 1,162,334), sulfurized Diels-Alder adducts (see for example U.S. Patent Nos. 3,632,566; 3,498,915; and Re 27,331), sulfurized dicyclopentadiene (see for example U.S. Patent Nos. 3,882,031 and 4,188,297), sulfurized or co-sulfurized mixtures of fatty acid esters and monounsaturated olefin (see for example U.S. Patent Nos. 4,149,982; 4,166,796; 4,166,797; 4,321,153; 4,481,140), co-sulfurized blends of fatty acid, fatty acid ester and α -olefin (see for example U.S. Patent No. 3,953,347), functionally-substituted dihydrocarbyl polysulfides (see for example U.S. Patent No. 4,218,332), thia-aldehydes, thia-ketones and derivatives thereof (e.g., acids, esters, imines, or lactones) (see for example, U.S. Patent No. 4,800,031; and PCT International Application Publication No. WO 88/03552), epithio compounds (see for example, U.S. Patent No. 4,217,233), sulfur-containing acetal derivatives (see for example U.S. Patent No. 4,248,723), co-sulfurized blends of terpene and acyclic olefins (see for example U.S. Patent No. 4,584,113), and polysulfide olefin products (see for example U.S. Patent No. 4,795,576).

30 Preferred materials useful as component (i) are sulfur-containing organic compounds in which the sulfur-containing species are bound directly to carbon or to more sulfur.

One particularly preferred class of such agents is made by reacting an olefin, such as isobutene, with sulfur. The product, e.g., sulfurized isobutene, preferably sulfurized polyisobutylene, typically has a sulfur content of 10 to 50%, preferably 30 to 50% by weight. A wide variety of other olefins or unsaturated hydrocarbons, e.g., isobutene dimer or trimer, may be used to form such agents.

35 Another particularly preferred class of such agents is that of polysulfides composed of one or more compounds represented by the formula: R⁶-S_x-R⁷ where R⁶ and R⁷ are hydrocarbyl groups each of which preferably contains 3 to 18 carbon atoms and x is preferably in the range of from 2 to 8, and more preferably in the range of from 2 to 5, especially 3. The hydrocarbyl groups can be of widely varying types such as alkyl, cycloalkyl, alkenyl, aryl, or aralkyl. Tertiary alkyl polysulfides such as di-tert-butyl trisulfide, and mixtures comprising di-tert-butyl trisulfide (e.g., a mixture 40 composed principally or entirely of the tri-, tetra-, and pentasulfides) are preferred. Examples of other useful dihydrocarbyl polysulfides include the diamyl polysulfides, the dinonyl polysulfides, the didodecyl polysulfides, and the dibenzyl polysulfides.

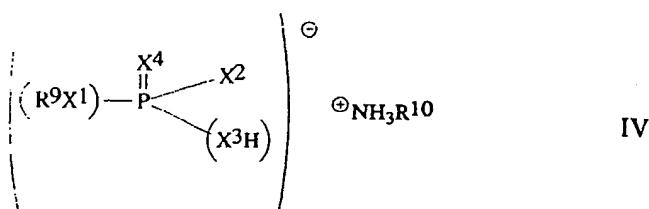

Component 3: Phosphorus-Containing Agents

45

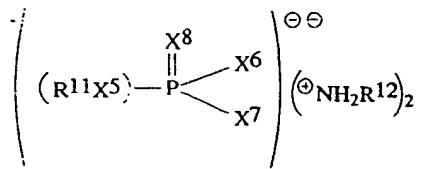

Component 3 is composed of one or more oil-soluble amine salts of one or more partial esters of one or more acids of phosphorus, preferably one or more partial esters of one or more acids of pentavalent phosphorus. Such compounds may be represented by the Formulas IV, V and VI:

50

55

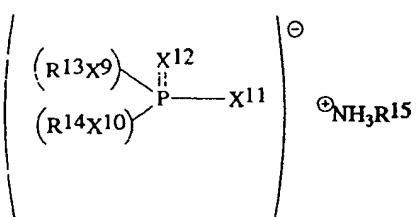

5

V

10

VI

15

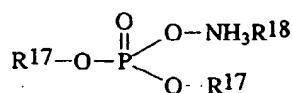

or mixtures thereof. In Formulas IV, V and VI, each of R^9 - R^{15} is, independently, a hydrocarbyl group and each of X^1 - X^{12} is independently, an oxygen atom or a sulfur atom.

Useful salts or adducts can be made of the one or more acids of pentavalent phosphorous and an amine selected from the group consisting of octylamine, nonylamine, decylamine, undecylamine, dodecylamine, tridecylamine, tetradecylamine, pentadecylamine, hexadecylamine, hepta-decylamine, octadecylamine, cyclohexylamine, phenylamine, mesitylamine, oleylamine, cocoamine, soyamine, C_{10-12} tertiary alkyl primary amines, and phenethylamine and mixtures of any such compounds. Secondary hydrocarbyl amines and tertiary hydrocarbyl amines can also be used either alone or in combination with each other or in combination with primary amines. Thus, any combination of primary, secondary and/or tertiary amines, whether monoamine or polyamine, can be used in forming the salts or adducts. Use of primary amines is preferred. It is perhaps worth noting that the above referred to partially esterified pentavalent acids of phosphorus have been named, for convenience, by use of the "thio-thiono" system of nomenclature. Such compounds can also be named by use of a "thioic" system of nomenclature. For example, S,S-dihydrocarbylphosphorotetrathioic acid, $(RS)_2P(S)(SH)$. Likewise, O,S-dihydrocarbylthiophosphoric acid is also known as O,S-dihydrocarbylphosphorodithioic acid, $(RO)(RS)P(S)(OH)$; S,S-dihydrocarbyldithiophosphoric acid is also known as S,S-dihydrocarbylphosphorodithioic acid, $(RS)_2P(O)(OH)$; and O,O-dihydrocarbylthionophosphoric acid is also known as O,O-dihydrocarbylphosphorothioic acid, $(RO)_2P(S)(OH)$.

Methods for the preparation of such amine salts are well known and reported in the literature. See for example, U.S. Patent Nos. 2,063,629; 2,224,695; 2,447,288; 2,616,905; 3,984,448; 4,431,552; Pesin et al, Zhumal Obshchei Khimii, Vol. 31, No. 8, pp. 2508-2515 (1961); and PCT International Application Publication No. WO 87/07638.

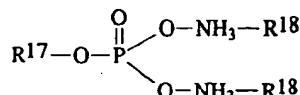

A typical version of component 3 consists of an approximately 80:20 to 20:80, preferably, approximately 50:50 mixture of compounds of the following two formulas VII and VIII where R^{17} is a hydrocarbyl group with 4-10 carbon atoms and R^{18} is a hydrocarbyl group of 8-22 carbon atoms:

45

VII,

50

VIII.

In a typical phosphorus-containing agent, R^{17} is a hydrocarbyl group of about 5 carbons (amyl acid phosphate), a hydrocarbyl group of about 8 carbons (2-ethyl hexyl acid phosphate), or octyl acid phosphate.

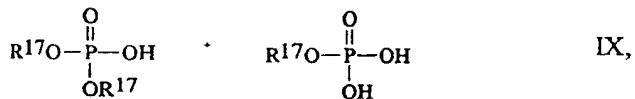

A typical R^{18} is a mixture of C_{18} mono-unsaturated and $C_{11}-C_{14}$ branched hydrocarbyl groups. A typical ratio in the mixture is 10-50% C_{18} and 50-90% $C_{11}-C_{14}$ ingredients, preferably 20-30% C_{18} and 70-80% $C_{11}-C_{14}$ ingredients, more preferably 25-30% C_{18} and 70-75% $C_{11}-C_{14}$. Examples of such amines include oleylamine (9-octadecen-1-amine)

and C₁₁-C₁₄ tertiary alkyl primary amine. Another typical amine is n-octylamine. The C₁₁-C₁₄ amine may be used alone, although the mixture achieves a better balance of wear and oxidation properties.

A typical reaction includes a mixture of approximately 50/50 di to mono-substituted, acid phosphate (dialkyl-and mono-alkyl phosphoric acids) of Formula IX:

5

10

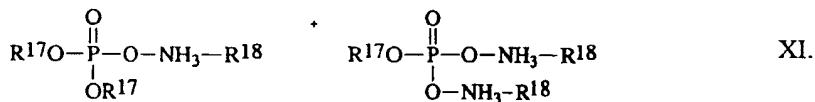

reacted with amines of Formula X:

15

The above reacts to form the phosphorus-containing agent which includes the mixture of compounds of Formula XI:

20

25

Diluents

30

The additive concentrates of this invention preferably contain a suitable diluent, most preferably an oleaginous diluent of suitable viscosity. Such diluent can be derived from natural or synthetic sources. Among the mineral (hydrocarbonaceous) oils are paraffin base, naphthenic base, asphaltic base and mixed base oils. Typical synthetic base oils include polyolefin oils (especially hydrogenated α -olefin oligomers), alkylated aromatic, polyalkylene oxides, aromatic ethers, and carboxylate esters (especially diester oils), among others. Blends of natural and synthetic oils can also be used. The preferred diluents are the light hydrocarbon base oils, both natural or synthetic. Generally the diluent oil will have a viscosity in the range of 13 to 35 centistokes at 40°C, and preferably in the range of 18.5 to 21.5 centistokes at 40°C. A 100 neutral mineral oil with a viscosity of about 19 centistokes at 40°C with a specific gravity (ASTM D 1298) in the range of 0.855 or 0.893 (most preferably about 0.879) at 15.6°C (60°F) and an ASTM color (D 1500) of 2 maximum or a 45 neutral hydrotreated mineral oil with a 40°C kinematic viscosity of about 4.5 centistokes, a specific gravity in the range of 0.85 to 0.88, and an ASTM color of 2 maximum are particularly preferred for this use.

40

Gear Oil Base Stocks

The gear oils in which the compositions of this invention are employed can be based on natural or synthetic oils, or blends thereof, provided the lubricant has a suitable viscosity for use in gear oil applications. Thus, the base oils will normally have a viscosity in the range of SAE 50 to SAE 250, and more usually will range from SAE 70W to SAE 140. Suitable automotive gear oils also include cross-grades such as 75W-140, 80W-90, 85W-140, 85W-90, and the like. The base oils for such use are generally mineral oil base stocks such as, for example, conventional and solvent-refined paraffinic neutrals and bright stocks, hydrotreated paraffinic neutrals and bright stocks, naphthenic oils, or cylinder oils, including straight run and blended oils. Synthetic base stocks can also be used in the practice of this invention, such as for example poly- α -olefin oils (PAO), alkylated aromatics, polybutenes, diesters, polyol esters, polyglycols, or polyphenyl ether, and blends thereof. Typical of such oils are blends of poly- α -olefins with synthetic diesters in weight proportions (PAO:ester) ranging from 95:5 to 50:50, typically, 75:25. Some base stocks work better than others towards meeting L-60-1 standards. For example, hydrotreated base stocks and synthetic base stocks are preferred.

45

Proportions

50

In forming the gear oils of this invention, the lubricant base stocks will usually contain above-described components 1, 2 and 3 in the following concentrations (weight percentages of active ingredients in the gear oils of this invention):

TABLE 1

Components	Preferred Range	More Preferred Range	Most Preferred Range
(1) Ashless Dispersant	0.3-3.0	0.6-2	0.7-1.4
(2) Sulfur-containing Agent	1-5.25	1.5-4.5	2-4
(3) Phosphorous-containing Agent	0.1-3	0.2-2	0.3-1.2

10 Optionally, other components, e.g., diluents, defoamers, etc., which follow are also present in the gear oil. However, the preferred compositions of this invention are essentially devoid of metal-containing components.

15 The composition of the present invention may be used as an additive concentrate. In the additive concentrates containing a diluent such as an oleaginous liquid, the total content of the concentrate in the oleaginous liquid should normally fall within the range of 1 to 13%, preferably 1.5 to 10% and most preferably 2 to 9% based on the total weight of the concentrate (including other ancillary components, if used).

20 The weight ratios of components (1), (2) and (3) in the additive concentrates of this invention will be at levels which will allow the ranges of TABLE 1 to be met when the concentrate is used at its proper dosage in oleaginous liquid. Other components, such as described below, can also be included in such additive concentrates.

25 Other Components

The gear oils and gear oil additive concentrates of this invention can contain various other conventional additives to partake of their attendant functions. These include, for example, the following materials:

25 Defoamers - Illustrative materials of this type include silicone oils of suitable viscosity, glycerol monostearate, polyglycol palmitate, trialkyl monothiophosphates, esters of sulfonated ricinoleic acid, benzoylacetone, methyl salicylate, glycerol monocoleate, glycerol dioleate, and the like. Defoamers are generally employed at concentrations of up to about 1% in the additive concentrate.

30 Demulsifiers - Typical additives which may be employed as demulsifiers in gear oils include alkyl benzene sulfonates, polyethylene oxides, polypropylene oxides, esters of oil soluble acids and the like. Such additives are generally employed at concentrations of up to about 3% in the additive concentrate.

35 Sulfur Scavengers - This class of additives includes such materials as thiadizoles, triazoles, and in general, compounds containing moieties reactive to free sulfur under elevated temperature conditions. See, for example, U.S. Patent Nos. 3,663,561 and 4,097,387. Concentrations of up to about 3% in the concentrate are typical.

40 Antioxidants - Ordinarily, antioxidants that may be employed in gear oil formulations include phenolic compounds, amines phosphites, and the like. Amounts of up to about 5% in the concentrate are generally sufficient. Other commonly used additives or components include anti-rust agents or rust inhibitors, corrosion inhibitors, detergents, dyes, metal deactivators, pour point depressants, and diluents.

45 Thus, the present intention covers compositions of boron-free ashless dispersant of type described as component 1, with a sulfur-containing agent described as Component 2, and a phosphorus containing agent described as Component 3 along with other optional components to produce an additive which, when blended in a suitable base oil (described in gear oil base stocks), can meet MT-1 and MIL-PRF-2105E requirements. MT-1 and MIL-PRF-2105E are requirements for a clean gear manual transmission oil (MT-1) and rear axle oil (MIL-PRF-2105E). Additives for this type of clean gear application have normally been formulated with boronated dispersant.

50 Benefits of using a boron-free dispersant include:

45 1. lower cost due to not having to add boron or do additional processing to attach the boron to the dispersant; and
 2. no precipitation from boron which detaches from the dispersant;

55 The MIL PRF-2105E Standard

50 The MIL-PRF-2105E standard (August 22, 1995) includes a large number of tests which must be passed. The MIL-PRF-2105E standard is published by the U.S. Army Tank Automotive and Armaments Command, Department of the Army, and is herein incorporated by reference in its entirety. The gear lubricating oils are of the following grades: 75W, 80W-90 and 85W-140.

55 To meet MIL-PRF-2105E, the gear oil has the properties specified by TABLE 2.

TABLE 2

Property ¹	Grade 75W	Grade 80W-90	Grade 85W-14

⁹ Copies for all ASTM test methods should be addressed to the American Society for Testing and Materials, 1916 Race Street, Philadelphia, Pennsylvania 19103, U.S.A.

Channel Point

30 The gear oil is non-channeling at the temperature indicated by TABLE 2 when tested in accordance with TABLE 3 (Method 3456 FED-STD-791).

Foaming

35 The oil has the following foaming characteristics when tested according to the test method listed on TABLE 4 (ASTM D 892).

- 40 a. In the initial test at $24 \pm 0.5^{\circ}\text{C}$. Not more than 20 mL of foam shall remain immediately following the 5-minute blowing period.
- b. Intermediate test at $93.5 \pm 0.5^{\circ}\text{C}$. Not more than 50 mL of foam shall remain immediately following the 5-minute blowing period.
- c. Final test at $24 \pm 0.5^{\circ}\text{C}$. Not more than 20 mL of foam shall remain immediately following the 5-minute blowing period.

Storage Stability

50 The gear oil shall demonstrate the characteristics for separated solid material, liquid material, or a combination of the two materials when tested in accordance with TABLE 3 (Method 3440, FED-STD-791). When the separated material is solid, the average increase in the weight of each centrifuge tube and residue over the initial weight of the clean tube shall not exceed 0.25 mass percent of the additive material originally contained in the sample. When the separated material is liquid, it shall not exceed 0.50 volume percent of the additive material originally contained in the sample.

Compatibility

55 The gear oil shall be compatible with other gear lubricants qualified under MIL-PRF-2105E in accordance with TABLE 3 (method 3430, FED-STD-791). Typically, the test is performed by subjecting separate mixtures of the oil with six selected reference oils.

Moisture Corrosion

The oil shall prevent or minimize corrosion to gear unit components in the presence of moisture. Satisfactory performance shall be demonstrated when the oil is tested in accordance with TABLE 3 (ASTM STP 512A, L-33 Test) and exhibits test results of one percent or less rust on a test cover plate and no rust on gear teeth, bearings and functional components.

Thermal and Oxidative Stability

10 The oil shall resist thermal and chemical oxidation. Satisfactory performance shall be demonstrated when the oil is tested in accordance with TABLE 3 (ASTM D-5704, L-60-1 Test) for 50 hours and meets the criteria of TABLE 4:

TABLE 4

Parameters	Limits
Kinematic Viscosity Increase %, @ 100°C, cSt	100 max
N-Pentane Insolubles, wt %	3.0 max
Toluene Insolubles, wt %	2.0 max
Carbon/Varnish Rating	7.5 min
Sludge Rating	9.4 min

15 If more than one test is conducted, then the average of two test results must meet the above limits. No more than three tests are allowed. When three tests are conducted, one of the three can be discarded and the average of the remaining two tests must meet the above limits. Typically, the oil has from about 0 to about 3.0 weight percent n-pentane insolubles, about 0 to about 2.0 weight percent toluene insolubles, a carbon/varnish rating of about 7.5 to about 10, and a sludge rating of about 9.4 to about 10. The limits are set by the military for MIL-PRF-2105E approval.

Load-carrying extreme-pressure and deposition characteristics

20 The oil shall prevent or minimize gear distress and lubricant deposits under conditions of high-speed and shock-loading and conditions of high-speed, low-torque and low-speed, high-torque operation.

Gear Scoring

25 Satisfactory performance shall be demonstrated when the oil is tested in duplicate in accordance with TABLE 3 (ASTM STP 512A, L-42 Test) and exhibits scoring less than or equal to ASTM Reference Oil RGO 114, or most recent blend approved by ASTM under conditions of high-speed and shock-loading.

30 For grade 75W oil, the L-42 gear scoring test shall be modified such that the sequence II (high-speed) portion of the test shall be commenced at a temperature of 79°C and sequence IV (shock-loading) run with water sprays on commencing at 93°C with a maximum rise of 5.5 to 8.3°C.

Gear Distress and Deposits

35 Satisfactory performance shall be demonstrated when the oil is tested in accordance with TABLE 3 (ASTM STP 512A, L-37 Test) using untreated and phosphate-treated gear assemblies and prevents gear-tooth ridging, rippling, pitting, welding, spalling, and excessive wear or other surface distress and objectionable deposits and does not produce excessive wear, pitting or corrosion of bearing rollers, or races under conditions low-speed, high-torque.

Copper Corrosion

40 The oil shall minimize copper corrosion. Satisfactory performance shall be demonstrated when the oil is tested in accordance with TABLE 3 (ASTM D 130) for 3 hours at $121 \pm 1^\circ\text{C}$ and exhibits copper strip discoloration not exceeding ASTM No. 2 when compared to the ASTM Copper Strip Corrosion Standard.

Cyclic Durability

45 Satisfactory performance shall be demonstrated when the oil is tested in accordance with TABLE 3 (ASTM D-

5579). The test evaluates the thermal stability of gear lubricants when subjected to cyclic operating conditions of high-low range and high temperature. The oil shall avoid deteriorating the synchronizer performance by preventing two unsynchronized shifts from occurring at cycles equal to or lower than the mean of the prior five passing reference oil results in the same test stand.

5

Elastomer Compatibility

10

The gear lubricants shall minimize deterioration of elastomer materials. Satisfactory performance shall be demonstrated when the oils are tested and rated in accordance with TABLE 3 (ASTM D-5662) and exhibits test results meeting the nominal criteria of TABLE 5 as adjusted to accommodate slight changes in individual elastomer batches:

The tests for L-60-1 carbon varnish and sludge rating involve employing the lubricating oil to lubricate a large gear and a small gear which mesh with each other in a test apparatus. A carbon/varnish measurement and a sludge measurement is made for the large gear front face, large gear rear face, small gear front face and small gear rear face. The carbon varnish rating is the average of the carbon varnish measurements of the large gear front face and large gear rear face. The sludge rating is the average of the sludge measurements at all four faces.

GL-5 has the specification listed in TABLE 7.

The present invention is further illustrated by the following non-limiting examples.

Examples

The following ingredients were employed to make compositions that were tested according to L-60-1 Carbon/Varnish Ratings and L-60-1 Sludge Ratings. These L-60-1 tests are standardized tests by ASTM. The L-60-1 procedure is included in ASTM Special Technical Publication STP 512A, "Laboratory Performance Tests Intended for API GL-5 Service" incorporated herein by reference.

The following TABLES 8-13 present the compositions of the tested additive concentrates and present the test results. In all the Examples of the present specification, the amounts of ingredients in the additive concentrates are presented as weight percents on a base oil-free basis. The type of base oil is also listed in the appropriate table unless otherwise stated. The presence of the base oil is indicated by an "X" in the TABLES unless otherwise stated.

The base oils employed are Mineral Oil A, Mineral Oil B, Mineral Oil C or Mineral Oil D. A. Mineral Oil A is an 80W-90 base oil which is a blend of two solvent refined base stocks (Pennzoil 150 Bright and Pennzoil 140 Neutral) with a small (less than 2 wt. %) amount of pour point depressant added. Mineral Oil B is an 85W-140 base oil which is a blend of two solvent refined base stocks (Pennzoil 150 Bright and Pennzoil 140 Neutral) with a small (less than 2 wt. %) amount of pour point depressant added. The pour point depressant used in Mineral Oils A and B is a solution of acrylic polymer in a severely refined mineral oil. Mineral Oil C is an 80W-90 base oil which is a blend of three solvent refined base stocks (Exxon 150 Bright, Exxon 60() Neutral and Exxon 150 Neutral) with a small (less than 2 wt. %) amount of HiTEC 672 (Ethyl Corporation) pour point depressant added. Mineral Oil D is an 85W-140 base oil which is also a blend of three solvent refined base stocks (Exxon 150 Bright, Exxon 600 Neutral and Exxon 150 Neutral) with a small (less than 2 wt. %) amount of HiTEC 672 (Ethyl Corporation) pour point depressant added.

The concentrates are generally present in an amount of about 7.50% of the total weight of base oil and concentrate unless otherwise stated. In all the TABLES for the Examples of the present specification, like numbered footnotes indicate like ingredients or parameters.

Example 1-6

Examples 1-6 of TABLE 8 show the effects of increasing dispersant and the effect of employing different molecular weight dispersants. In these Examples, the concentrates are present at a concentration of 7 weight percent in 85W-140 Mineral Oil B.

The data of Tables 10 and 11 demonstrates the passing (by MIL-PRF-2105E and MT-1 standards) L-60-1 sludge and carbon/varnish performance of clean gear additive which uses unboronated Succinimide A, when the additive is blended in several base stocks and viscosity grades.

Examples 15-16

Examples 15-16 of TABLE 12 employ oil treated with 7.5 wt % additive.

TABLE 12

Notes: See TABLE 12

²³ Boronated 1300 MW polybutenyl succinimide, produced from acylating polyisobutylene with maleic anhydride and reacting the acylated hydrocarbon with polyethylene amines. The resulting succinimide is reacted with boric acid to yield a boronated succinimide.

45 After 36 days the product of Example 17 was still clear and the product of Example 18 was heavy precipitate. It should be apparent that the many modifications may be made to the above-described embodiments and yet, still come within the spirit and scope of the present invention. Thus, the present invention is not limited by the above-described embodiments. Rather, the present invention is defined by the claims appended hereto.

50

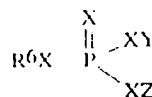

Claims

1. A lubricating oil composition comprising:

55

a base oil;
 at least one boron-free ashless dispersant selected from hydrocarbyl substituted succinimides, hydrocarbyl substituted succinic acids and hydrocarbyl substituted succinamides;
 at least one sulfur source selected from sulfurized polyisobutylenes and polysulfides; and

at least one phosphorus source selected from oil-soluble amine salts of formula:

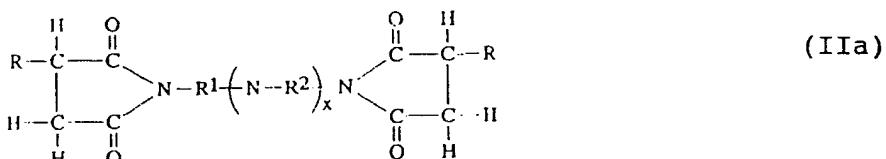

10 in which R^6 is a hydrocarbyl group having 2 to 12 carbon atoms, each X is independently S or O, Y is a hydrocarbyl group having 2 to 12 carbon atoms, $+NH_3R^7$ or H, R^7 is a hydrocarbyl group having 4 to 30 carbon atoms, Z is a hydrocarbyl group having 2 to 12 carbon atoms, $+NH_3R^8$ or H and R^8 is a hydrocarbyl group having 4 to 30 carbon atoms, provided that Y is $+NH_3R^7$ and/or Z is $+NH_3R^8$;

15 wherein the total amount of the ashless dispersant, sulfur source and phosphorus source is 1 to 10 percent by weight of the lubricating oil composition and wherein the proportions of the dispersant, the sulfur source and the phosphorus source are such that the lubricating oil composition has an L-60-1 carbon/varnish rating of at least about 7.5 and an L-60-1 sludge rating of at least about 9.4.

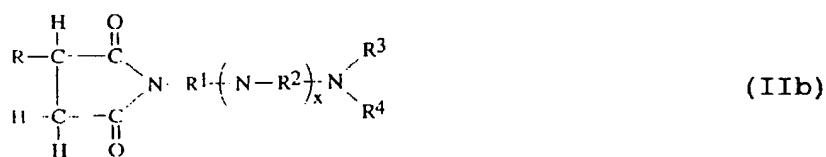

20 2. A composition according to claim 1, wherein R^6 is a hydrocarbyl group having 4 to 10 carbon atoms, R^7 is a hydrocarbyl group having 8 to 22 carbon atoms and R^8 is a hydrocarbyl group containing 8 to 22 carbon atoms.

3. A composition according to claim 1 or claim 2, wherein the boron-free ashless dispersant is selected from compounds of formula IIa or IIb:

25

35

40

in which R is a polyalkyl moiety, R^1 is an alkylene group having 1 to 40 carbon atoms, R^2 is an alkylene group having 1 to 40 carbon atoms,

R^3 is selected from H and alkyl having 1 to 40 carbon atoms, R^4 is selected from H and alkyl having 1 to 40 carbon atoms, and x is an integer from 0 to 12.

45

4. A composition according to any one of the preceding claims, wherein the L-60-1 carbon/varnish rating is from 7.5 to 10.

5. A composition according to any one of the preceding claims, wherein the L-60-1 sludge rating is from 9.4 to 10.

50 6. A composition according to any one of claims 3 to 5, wherein R^1 is an alkylene group having 1 to 10 carbon atoms, R^2 is an alkylene group having 1 to 10 carbon atoms, R^3 is selected from H and alkyl having 1 to 10 carbon atoms, R^4 is selected from H and alkyl having 1 to 10 carbon atoms, and x is an integer from 2 to 8.

55 7. A composition according to any one of claims 3 to 6, wherein R is a polymer of at least one mono-olefin having from 2 to 30 carbon atoms per mono-olefin.

8. A composition according to claim 7, wherein R is a polymer of at least one mono-olefin having from 2 to 8 carbon

atoms per mono-olefin.

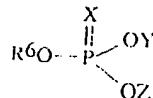

9. A composition according to any one of claims 3 to 8, wherein R is a polyisobutyl moiety having a number average molecular weight of 750 to 2500.

5 10. A composition according to any one of claims 3 to 9, wherein R¹ is (CH₂)_n wherein n is an integer from 1 to 5, R² is (CH₂)_m wherein m is an integer from 1 to 5, R³ is H or an alkyl group having from 1 to 5 carbon atoms, R⁴ is H or an alkyl group having from 1 to 5 carbon atoms, and x is an integer from 2 to 5.

10 11. A composition according to any one of the preceding claims, wherein the sulfur source is sulfurized polyisobutylene.

12. A composition according to any one of the preceding claims, wherein the phosphorus source has the formula:

15

20

wherein R⁶, X, Y and Z are as defined in claim 1.

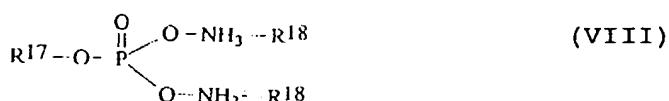

25

13. A composition according to claim 12, wherein the phosphorus source comprises a mixture of compounds of formulae VII and VIII:

30

35

50

in which R¹⁷ is a hydrocarbyl group having 2 to 12 carbon atoms and each R¹⁸ is independently a hydrocarbyl group having 4 to 30 carbon atoms.

40 14. A composition according to claim 13, wherein the weight ratio of the compound of formula VII to the compound of formula VIII is 80:20 to 20:80.

15. A composition according to claim 13 or 14, wherein R¹⁷ is a hydrocarbyl group having 4 to 10 carbon atoms.

45 16. A composition according to any one of the preceding claims, further comprising at least one defoamer, demulsifier, sulfur scavenger and/or antioxidant.

17. A composition according to any one of the preceding claims, comprising 0.26 to 3 percent by weight of the ashless dispersant, 1 to 5.25 percent by weight of the sulfur source, and 0.1 to 3 percent by weight of the phosphorus source.

55

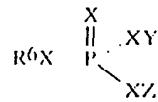

18. A clean gear additive concentrate comprising:

55

at least one boron free ashless dispersant selected from hydrocarbyl substituted succinimides, hydrocarbyl substituted succinic acids and hydrocarbyl substituted succinamides;

at least one sulfur source selected from sulfurized polyisobutylenes and polysulfides; and

at least one phosphorus source selected from oil-soluble amine salts of formula:

5

in which R^6 , X, Y and Z are as defined in claim 1;

10 wherein the proportions of the dispersant, the sulfur source and the phosphorus source are such that a lubricating oil composition comprising a base oil and the dispersant, sulfur source and phosphorus source has an L-60-1 carbon/varnish rating of at least about 7.5 and an L-60-1 sludge rating of at least about 9.4 when the total amount of the ashless dispersant, sulfur source and phosphorus source is 1 to 10 percent by weight of the lubricating oil composition.

15 19. A concentrate according to claim 18, wherein the boron-free ashless dispersant is as defined in any one of claims 3 and 6 to 10.

20 20. A concentrate according to claim 18 or 19, wherein the sulfur source is as defined in claim 11.

20 21. A concentrate according to any one of claims 18 to 20, wherein the phosphorus source is as defined in any one of claims 2 and 12 to 15.

25 22. A concentrate according to any one of claims 18 to 21, further comprising at least one defoamer, demulsifier, sulfur scavenger and/or antioxidant.

25 23. A process for preparing a lubricating oil composition as claimed in claim 1, which process comprises combining a base oil with the boron-free ashless dispersant, the sulfur source and the phosphorous source.

30 24. Use of a lubricating oil composition as claimed in any one of claims 1 to 17, to lubricate a motor vehicle manual transmission or a motor vehicle rear axle.

(54) Boron-free additive composition, method for producing same and using in lubrication of motor vehicle gears.

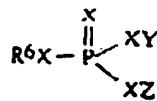

(57) A lubricating oil composition comprising:

a base oil;

at least one boron-free ashless dispersant selected from hydrocarbyl substituted succinimides, hydrocarbyl substituted succinic acids and hydrocarbyl substituted succinamides;

at least one sulfur source selected from sulfurized polyisobutylenes and polysulfides; and

at least one phosphorus source selected from oil-soluble amine salts of formula:

in which R⁶ is a hydrocarbyl group having 2 to 12 carbon atoms, each X is independently S or O, Y is selected from a hydrocarbyl group having 2 to 12 carbon atoms, +NH₃R⁷ or H, R⁷ is a hydrocarbyl group having 4 to 30 carbon atoms, Z is selected from a hydrocarbyl group having 2 to 12 carbon atoms, +NH₃R⁸ or H and R⁸ is a hydrocarbyl group having 4 to 30 carbon atoms, provided that Y is +NH₃R⁷ and/or Z is +NHR⁸;
wherein the total amount of the ashless dispersant, sulfur source and phosphorus source is 1 to 10 percent by weight of the lubricating oil composition and wherein the proportions of the dispersant, the sulfur source and the phosphorus source are selected such that the lubricating oil composition has an L-60-1 carbon/varnish rating of at least about 7.5 and an L-60-1 sludge rating of at least about 9.4.
